Physics

**Advanced Subsidiary
Unit 2: Physics at Work**

Monday 9 June 2014 – Morning
Time: 1 hour 30 minutes

Paper Reference

6PH02/01

You do not need any other materials.

Total Marks

Instructions

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions.
- Answer the questions in the spaces provided
– *there may be more space than you need.*

Information

- The total mark for this paper is 80.
- The marks for **each** question are shown in brackets
– *use this as a guide as to how much time to spend on each question.*
- Questions labelled with an **asterisk** (*) are ones where the quality of your written communication will be assessed
– *you should take particular care with your spelling, punctuation and grammar, as well as the clarity of expression, on these questions.*
- The list of data, formulae and relationships is printed at the end of this booklet.
- Candidates may use a scientific calculator.

Advice

- Read each question carefully before you start to answer it.
- Keep an eye on the time.
- Try to answer every question.
- Check your answers if you have time at the end.

PEARSON

SECTION A

Answer ALL questions.

For questions 1–10, in Section A, select one answer from A to D and put a cross in the box . If you change your mind, put a line through the box and then mark your new answer with a cross .

1 The distance travelled by a wave during one oscillation may be described as

- A frequency.
- B period.
- C wavelength.
- D wave speed.

(Total for Question 1 = 1 mark)

2 An electric torch uses two 1.5 V cells. The torch bulb is marked 2.4 V, 270 mA.

What is the resistance of the torch bulb?

- A 0.81 Ω
- B 0.65 Ω
- C 8.9 Ω
- D 11 Ω

(Total for Question 2 = 1 mark)

3 All electrical components have resistance.

In which of the following situations would the resistance of the stated component **not** increase?

- A Increasing the current through a filament lamp.
- B Increasing the temperature of a metal wire.
- C Increasing the temperature of a negative temperature coefficient thermistor.
- D Reversing the direction of a diode in forward bias in a circuit.

(Total for Question 3 = 1 mark)

4 Which of the following phenomena does **not** occur with sound waves?

- A diffraction
- B interference
- C polarisation
- D refraction

(Total for Question 4 = 1 mark)

5 A lamp illuminates a surface of area 0.80 m^2 with radiation flux of 0.50 W m^{-2} .

The rate, in watts, at which light energy strikes the illuminated surface is given by

- A 0.50×0.80^2
- B 0.50×0.80
- C $0.50 \div 0.80$
- D $0.80 \div 0.50$

(Total for Question 5 = 1 mark)

- 6 The diagram represents a resistor of resistance R in a series circuit with a cell of e.m.f. ε and internal resistance r .

Which of the following correctly gives the potential difference V across the internal resistance?

- A $V = \frac{\varepsilon(R+r)}{r}$
- B $V = \frac{\varepsilon R}{R+r}$
- C $V = \frac{\varepsilon(R+r)}{R}$
- D $V = \frac{\varepsilon r}{(R+r)}$

(Total for Question 6 = 1 mark)

- 7 Which of the following is a type of electromagnetic radiation with a wavelength longer than infrared?

- A microwave
- B ultrasound
- C ultraviolet
- D X-rays

(Total for Question 7 = 1 mark)

- 8 A beam of electrons spreads out into several distinct beams after passing through a crystalline material.

This demonstrates that

- A electrons behave as particles.
- B electrons behave as waves.
- C electrons exist in energy levels.
- D electrons have negative charge.

(Total for Question 8 = 1 mark)

- 9 Light in medium 1 strikes a boundary with medium 2 which is also transparent. The diagram shows what happens.

Which of the following can be deduced?

- A The critical angle for light travelling from medium 1 into medium 2 is 53° .
- B The refractive index of medium 1 is greater than the refractive index of medium 2.
- C The speed of light in medium 1 is greater than the speed of light in medium 2.
- D The frequency of light in medium 1 is less than the frequency of light in medium 2.

(Total for Question 9 = 1 mark)

- 10 A rechargeable cell stores a maximum energy of 4200 J. The cell has an e.m.f. of 1.5 V and after 2.0 hours use the cell is completely discharged.

Assuming the e.m.f. stays constant, the charge passing through the cell during this time is

- A 1400 C
- B 2800 C
- C 5600 C
- D 6300 C

(Total for Question 10 = 1 mark)

TOTAL FOR SECTION A = 10 MARKS

SECTION B

Answer ALL questions in the spaces provided.

- 11** In February 2013 the largest known meteor for a century exploded over the Ural region of Russia.

The explosion was detected by stations monitoring infrasound, a type of sound with a frequency too low for humans to hear.

Describe how infrasound travels through the air.

(Total for Question 15 = 6 marks)

16 An electric kettle is used to heat water from room temperature to boiling point.

(a) (i) Calculate the electrical power used by the kettle.

potential difference = 230 V

current = 12.5 A

(2)

Electrical power =

(ii) The kettle is switched on for 140 s.

Calculate the total energy supplied to the kettle.

(2)

Total energy supplied =

(iii) The amount of thermal energy transferred to the water is calculated to be 351 000 J.

Calculate the efficiency of the kettle at heating the water.

(2)

Efficiency =

(b) A student suggests that the useful energy required is thermal and the kettle only produces thermal energy, so it should be 100 % efficient.

Discuss this suggestion.

(2)

(Total for Question 16 = 8 marks)

17 A helium-neon gas laser is often used in the laboratory as a source of high intensity, coherent, monochromatic light.

The diagram shows some of the energy levels above the ground level E_3 for helium atoms and for neon atoms. The highest shown levels for helium atoms and neon atoms are almost identical.

Helium atoms in the gas are excited to level E_2 by the current passing through the laser. They collide at high speed with neon atoms. Because the energies are so similar, the energy is transferred from the helium atoms to the neon atoms. The neon atoms become excited in turn to level E_3 . As the neon atoms subsequently drop to level E_2 they emit photons.

(a) Explain what is meant by a photon. (2)

.....

.....

.....

(b) Calculate the frequency of the photons produced as the neon atoms drop from level E_3 to level E_2 . (3)

.....

.....

.....

.....

Frequency =

- (c) An electron in level E_3 of neon has 0.05 eV more energy than an electron in level E_2 of helium.

Suggest the source of the energy to make up this difference.

(1)

- (d) The photograph shows a device for making a vertical slit with variable width.

© THORLABS, Inc.

When the slit is fully open a laser beam is shone through it and a single point of light is seen on a screen.

As the slit is reduced in width the point of light becomes a horizontal line that gets longer as the slit gets narrower.

Explain this observation.

(3)

(Total for Question 17 = 9 marks)

18 Photograph 1 shows a rheostat (a variable resistor).

Photograph 1

The rheostat is made of a long resistance wire coiled around an insulating cylinder. The turns of wire are also separated from each other by insulation of negligible thickness. The ends of the wire are connected to the sockets A and B at either end and there is a sliding contact in the centre connected to the socket C. The resistance between A and C is varied by moving the sliding contact.

- (a) A student decides to determine the resistivity of the material from which the wire is made by measuring the dimensions of the wire and its resistance.

Photograph 2 shows a section of the rheostat and a scale.

Photograph 2

- (i) Take measurements from the photograph and use them to show that the cross-sectional area of the wire is about $2 \times 10^{-7} \text{ m}^2$.

(3)

.....

.....

.....

.....

(ii) Calculate the resistivity of the material from which the wire is made.

resistance of wire = 22Ω

length of wire = 12 m

(3)

Resistivity =

(iii) Suggest an advantage for the student of using a photograph rather than taking direct measurements.

(1)

(b) The coil of the rheostat is 10.2 cm long. A potential difference of 12 V is applied across AB and the slider C is 7.0 cm from the end of the coil near A.

Calculate the potential difference across AC.

(2)

Potential difference =

(Total for Question 18 = 9 marks)

19 Meteorologists use radar to monitor rain.

Radar uses pulses of microwaves. The emitted pulses are directed horizontally towards rain. The pulses are reflected from the rain and detected. The time taken for the reflected pulses to return, their intensity and frequency are all measured.

***(a)** Explain how these measurements can be used to determine the distance to the rain, the relative speed of the rain towards the detector and the amount of rain falling.

(6)

(b) (i) Explain why pulses of microwaves are used rather than a continuous beam. (1)

.....

.....

(ii) Calculate the maximum pulse duration which would enable distances between 5 km and 200 km to be measured. (3)

.....

.....

.....

Maximum pulse duration =

(Total for Question 19 = 10 marks)

BLANK PAGE

- 20 A book entitled *Interesting Projects with a Microwave Oven* suggests using chocolate to measure the speed of light. The chocolate is placed on a non-metallic tray in the oven. The oven is switched on and a pattern is observed in the melting chocolate.

The photograph shows some lighter areas where the chocolate is melting and some darker areas where the chocolate remains hard.

The book states that microwaves are emitted from the source in the oven. The microwaves reflect off the metal walls so that the microwaves reaching any point arrive from different directions. The microwaves produce a standing wave pattern causing hot and cold areas in the oven.

The wavelength was determined to be 12 cm by measuring the distance between adjacent hot and cold areas.

(a) The diagram shows two different paths by which microwaves can reach the point Z.

Not to scale

$SX = 9 \text{ cm}$, $XZ = 23 \text{ cm}$, $SY = 36 \text{ cm}$, $YZ = 8 \text{ cm}$

Calculate the phase difference between microwaves from the source at S reaching point Z by the two different paths.

(2)

.....

.....

.....

Phase difference =

(b) Explain how a pattern of hot and cold areas is produced in the chocolate. You should assume that each point of the chocolate is reached by microwaves following two different paths only.

(4)

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

(c) Explain why the microwaves reaching a point in the chocolate must be coherent for this effect to occur.

(2)

.....

.....

.....

.....

(d) The microwave frequency is stated on the oven as 2450 MHz.

Evaluate the success of this experiment at determining the speed of light.

(3)
